CIS Configuration Assessment Report

Ubuntu Linux 24.04 LTS | Wazuh Security Configuration Assessment

Lab author: Esteban Salinas
Assessment: December 15, 2025 | **Report revision:** October 20, 2026

Assessment summary

This personal lab assessed an Ubuntu endpoint using the CIS Ubuntu Linux 24.04 LTS Benchmark v1.0.0 through Wazuh SCA. The exported dataset contains 279 automated checks. This revision corrects finding references against the original CSV; it does not represent a new scan.

Total checks	Passed	Failed	Not applicable	Displayed score
279	122	115	42	51%

The 51% value is the benchmark score shown in the retained Wazuh dashboard. It is not an organization-wide compliance rating or proof that a mapped framework requirement has been satisfied.

Scope and evidence

Source evidence consists of the repository CSV export and retained Wazuh dashboard screenshots. Counts and the selected ID/title/result combinations below were checked against the CSV. Live configuration validation, remediation, and a follow-up scan are outside the completed scope.

Selected failed checks

Wazuh ID	Check title - from source CSV	Result
35619	Ensure a single firewall configuration utility is in use.	Failed
35624	Ensure ufw default deny firewall policy.	Failed
35604	Ensure dccp kernel module is not available.	Failed
35671	Ensure libpam-pwquality is installed.	Failed
35677	Ensure password unlock time is configured.	Failed
35528	Ensure separate partition exists for /var/log.	Failed

These six items are a selected sample of 115 failed checks. No exhaustive category totals or validated risk ratings are assigned. A failed automated check requires review of its evidence, applicability, and operational context.

Review and follow-up

Proposed next steps - not completed remediation

Wazuh ID	Validation to perform
35619	Review the installed and active firewall utilities and determine which tool should manage the host firewall.
35624	Inspect the effective UFW policy and whether UFW is the selected firewall tool. Preserve required management access before any approved change.
35604	Check whether DCCP support is available and needed. Review the assessment rule and module state before choosing a change.
35671	Verify the package status and the authentication design. Package presence alone does not establish that a password policy is effective.
35677	Review the relevant PAM configuration and unlock-time settings against the benchmark and the accounts' purpose.
35528	Inspect the filesystem layout and log-growth controls. Evaluate whether a separate filesystem or a documented alternative is appropriate for this VM.

Framework references and their limits

Framework references below are copied from the selected rows' Compliance metadata. They indicate possible relationships for review, not independent validation of the complete controls. The full mapping metadata remains in the CSV.

Wazuh ID	CIS reference	NIST SP 800-53 reference
35619	4.1.1	SC-7(5)
35677	5.3.3.1.2	AC-2(1)
35528	1.1.2.6.1	Not supplied in this row

Completion and revision record

Completed: automated assessment, CSV export, dashboard review, and a source-data consistency check for this revised report. Remaining: manual validation of selected findings, context-based risk assessment, approved remediation, and verification. This revision replaces the original report's mismatched finding references and unsupported category totals.
